Workforce360
Centralized Authentication Services for Enterprises
The nature of work is evolving. Your employees, data and devices are no longer constrained within the confines of a corporate network. As your workforce becomes more mobile, they need the ability to use more devices, including their own, to work at any time and anywhere. And you must make this access as seamless and convenient as possible to maximize productivity.

At the same time, you’re trying to keep up with the exponential growth of data and applications. This rapid onboarding of new apps and services has resulted in unintended authentication silos for many enterprises. The challenges of maintaining such an environment can create operational inefficiencies, greater security risks and inconsistent experiences for employees.

The siloed environment that’s often created in pursuit of digital transformation is the very thing that slows the pace of transformation initiatives. If you lack a strong, centralized identity foundation, you won’t have a uniform way to onboard and manage new resources or integrate existing ones. You’re left with poor visibility and an inability to centrally manage your ecosystems.

Getting identity right is the key to digital transformation success. Ping’s Workforce360 solution provides the global authentication authority you need to break down authentication silos and deliver consistent employee login experiences.

Workforce360 provides centralized authentication services to connect any user, on any app and any device within your organization. With an authentication authority in place, you’re able to easily integrate and onboard resources at scale. Workforce360 provides the identity foundation required for digital transformation so you can meet the needs of your enterprise, wherever it needs to go.
INCREASE EMPLOYEE PRODUCTIVITY

Disjointed and cumbersome login experiences shouldn’t slow down the user experience. No matter what they’re accessing—whether a SaaS or on-premises app—users need a consistent and fast way to access the information they need. That means fewer passwords, fewer login prompts and a single place to access all of their applications.

Workforce360 increases employee productivity through:

- Enabling single sign-on (SSO) with one-click access to applications
- Providing convenient ways to authenticate on work devices and in BYOD scenarios
- Reducing password requirements when they’re unnecessary—and providing self-service resets when they are
- Delivering a consistent and customizable experience across all types of applications

ENABLE ZERO TRUST SECURITY

The notion of identity perimeters and Zero Trust has gained traction in response to the increase in remote work and the growth of cloud adoption within the enterprise. Centralized authentication services allow organizations to easily integrate security policies and capabilities to all of their resources. By adding features like intelligent multi-factor authentication (MFA) and passwordless authentication, enterprises can significantly reduce their security risk while improving the employee experience.

Workforce360 strengthens enterprise security by:

- Reducing the use of passwords and extending MFA everywhere
- Leveraging contextual and adaptive policies to adjust authentication requirements based on risk
- Providing a consistent unified authentication experience with advanced features like passwordless
- Enabling group and application-level policies and integration with your identity ecosystem

INCREASE AGILITY AND SPEED

As you embark on or continue your digital transformation journey, you need an identity solution that can keep up with the growth of new resources, especially applications and APIs. At the same time, that solution must provide coverage for the entire IT stack, including legacy and homegrown applications, which remain mission-critical. Centralized authentication services let you manage all of your resources in one place and keep pace with the needs of the business.

Workforce360 enables enterprises to be more agile by:

- Rapidly onboarding new applications through self-service templates and APIs
- Providing coverage for all app types through open standards and token mediation
- Enabling co-existence with and eventual replacement of legacy directories and WAM providers on your own timeline
- Connecting to legacy apps via specific integration kits and adapters
DO CLOUD YOUR WAY

You need an authentication authority that can span all enterprise workloads in a multi-cloud, hybrid IT environment and provide identity coverage for all application types. You also need the flexibility to deploy your identity solution anywhere. Enterprises partner with Ping because of this versatility and how it helps them achieve true identity independence that is not tied to one environment or ecosystem.

**Workforce360** can be deployed wherever your enterprise requires:

- **PingCloud**: Use Ping’s private IDaaS solution for a no-maintenance, easy-to-manage identity solution in the cloud.
- **Cloud of Your Choice**: Leverage modern cloud automation and orchestration capabilities, including Docker images, to deploy Ping solutions to any cloud.
- **On-premises**: Maintain complete control over mission-critical applications and resources by deploying to your on-premises data center.

GET STARTED

**Workforce360** empowers you to support workforce productivity while implementing Zero Trust security and keeping IT agile to meet changing business needs. And getting started couldn’t be easier. You have the support of Ping’s Professional Services global ecosystem of partners to rapidly deploy a global authentication authority and deliver value from day one.
