MUCH MORE THAN JUST SSO TO GOOGLE APPS™
Despite their inherent management pain, passwords serve an important security purpose. However, in today’s world that’s increasingly driven by Google, apps and devices, passwords and what they protect have morphed into something new—personal identities. It only makes sense that security and identity management meet face-to-face, namely with standards-based, federated single sign-on (SSO). With identity management, identities are secured, but these solutions also eliminate the multiple login and password management headache.

**PROBLEM SOLVED**

Safeguard employee, customer and partner identities with Ping’s standards-based cloud identity solutions for Google Apps and other apps.

**ELIMINATE MULTIPLE LOGIN HEADACHES**

With the Ping Identity Google Apps Connector, users simply sign on to the corporate network to access all of their Google Apps. Plus, to accommodate devices and clients without SSO support, our password manager allows you to create a complex, random password to use for authentication.

**SAY “YES” TO BYOD**

Uneasy about personal devices? The Ping Identity Google Apps Connector includes a Google Password Manager app that allows users to accommodate their mobile devices with random passwords they can generate and update.
GAIN CONTROL AND SECURITY WITH AUTOMATED CLOUD USER PROVISIONING

Streamline cloud user provisioning and automatically enable and disable users to prevent unauthorized access. With our automated cloud user provisioning, you can automatically create, update and disable Google Apps accounts based on an employee's lifecycle.

CONTROL WHEN, WHERE AND HOW USERS CAN ACCESS GOOGLE APPS AND OTHERS

Centralize IT control of cloud access with adaptive federation by defining policies to address a very flexible set of user access scenarios. Authentication rules permit access to Google Apps based on rules such as IP address, device or even the time of day. Authentication chaining performs multi-factor authentication leveraging various methods, and token authorization evaluates user attributes and directs users accordingly, for example, to the preferred language version of a website.

ENJOY 100% CLOUD-BASED IDENTITY MANAGEMENT

No need for on-premises user stores, hardware or servers. Ping Identity gives you 100% cloud-based user identity management directly in Google Apps.

DEPLOY IN A MATTER OF MINUTES

Quickly setup Google as your user directory in as little as 30 minutes. Ping Identity solutions work with your existing identity and application infrastructures and easily accommodate additional software-as-a-service (SaaS) applications.

“When you interview business stakeholders about their business pain and frustration around IAM, you hear the same complaints over and over again: among others, too many passwords, too much time spent waiting for the right access to applications and data, and too slow a process for onboarding a business partner. The inability to access applications in a timely fashion will affect your company's ability to serve your customers well.”

Forrester® – Simplify Identity and Access Management Processes to Reduce Costs, Increase Business Efficiency, and Make Users Happy
WHY PING IDENTITY?

Ping delivers standards-based SSO support for Google Apps, allowing enterprise users to access Gmail, Google Docs, Google Apps Marketplace and more via browser, mobile and desktop apps, along with all of the other applications we support.

LEVERAGE THE SECURITY OF NEXT-GEN IDENTITY

Ping delivers standards-based identity security that meets workforce, partner and customer needs for secure access to the applications and resources they use every day. Our industry-leading identity solution:

• Scales identity management capabilities to web pages or APIs on any device or browser.
• Operates with any identity management solution so you’re free to choose whatever technology you need.
• Reduces operational cost and complexity by being managed in the cloud.
